High-performance liquid chromatography
 (HPLC; formerly referred to as high-pressure
 liquid chromatography), is a technique in
 analytical chemistry used to separate,
 identify, and quantify each component in a
 mixture. It relies on pumps to pass a
 pressurized liquid solvent containing the
 sample mixture through a column filled with a
 solid adsorbent material., The most common
 causes for peak splitting are i) too strong
 injection solvent compared to mobile phase
 composition at elution, ii) column
 channelling, iii) partially clogged part of the
