Depending on how biocompatibility is defined, the term may include ad-, One consequence of this tendency is that dental materials are now the subject of special regulations and directives in almost all countries of the world, intended to guarantee efficiency, safety, and quality and to make sure that only biocompatible materials are brought on the market., Due to the diversity of adverse biological effects which might be caused by dental restorative materials, biocompatibility assessment cannot rely on a single test but has to be based on a planned and structured approach (concept)., With the long history of use of many materials in dental surgery, biocompatibility concerns are not as great a concern as other issues, such as long-term degradation, mechanical strength problems, and prevention of secondary caries., The clinical success of dental materials is dependent not only on physical and chemical properties, but also on

biological reliability. Materials containing resin, which are used in restorative dentistry, have the potential to create local or systemic reactions on tissues such as the pulp., Materials influence biocompatibility through surface topography and chemistry and by the presence of extractable chemical compounds or foreign particulates. Material characterization is useful for screening new materials and evaluating manufacturing processes., A balanced discussion of the biocompatibility of dental amalgam requires consideration of the relative biocompatibility of other restorative materials that potentially could serve as alternatives to amalgam., Dental material biocompatibility has long been described throughout the dental literature, however, information about the factors that determine biocompatibility responses is only, In some cases, such as for dental devices, the biocompatibility recommendations in the device-specific standard should be used instead of the recommendations outlined in ISO 10993-1., Biocompatibility tests Swetha, et al. 2 International Dental & Medical Journal of
