Detailed Study of Photosynthesis - Higher

Level Photosynthesis is split into 2 main

stages, the Light and the Dark Stage.,

Photosynthesis is a process used by plants

and other organisms to convert light energy

into chemical energy that can later be

released to fuel the organisms' activities

(energy transformation).This chemical

energy is stored in carbohydrate molecules,

such as sugars, which are synthesized from

carbon dioxide and water - hence the

name photosynthesis, from the Greek

Ingen-Housz FRS (8 December 1730 - 7

September 1799) was a Dutch physiologist,

biologist and chemist.. He is best known for

discovering photosynthesis by showing that

light is essential to the process by which

green plants absorb carbon dioxide and

release oxygen. He also discovered that plants, like animals, have cellular respiration.

It is a member of the chalcogen group on the periodic table, a highly reactive nonmetal, and an oxidizing agent that readily forms oxides with most elements as well as with other compounds. By mass, oxygen is the third-most abundant element in the universe, after hydrogen and helium. At standard temperature and pressure, two atoms ..., 1
