Fundamental equations solved in GCMs 1.

Conservation of energy (the first law of

thermodynamics) i.e. Input energy = increase

in internal energy plus work done 2.

Conservation of momentum (Newton's

second law of motion) i.e. Force = mass \times

acceleration 3. Conservation of mass (the

continuity equation) i.e., A Climate Modelling

Primer, Fourth Edition is designed to explain

the basis and mechanisms of all types of

current physically-based climate models. A

thoroughly revised and updated edition, this

book will assist the reader in understanding

the complexities and applicabilities of

today's wide range of climate models., A

All books are in clear copy here, and all files are secure so don't worry about it., Fundamental principles used in climate modeling will be covered, UNIX and the programming language FORTRAN will be introduced, and we will run our own simple computer models to illustrate those principles. We will download data from simulations with comprehensive climate models and analyze them using the software FERRET (google "ferret noaa"), Buy The Climate Modelling Primer, 4th Edition on Amazon.com FREE SHIPPING on qualified orders, 591 Chapter 8 Climate Models and Their Evaluation Executive Summary This chapter assesses the capacity of the global climate models used elsewhere in this report for projecting future, Climate models are based on well-documented physical processes to simulate the transfer of energy and materials through the climate system. Climate models, also known as general

circulation models or GCMs, use mathematical equations to characterize how energy and matter interact in different parts of the ocean, atmosphere, land.
