results, Description. Transaction processing  
is designed to maintain a system's Integrity  
(typically a database or some modern  
filesystems) in a known, consistent state, by  
ensuring that interdependent operations on  
the system are either all completed  
successfully or all canceled successfully..  
For example, consider a typical banking  
transaction that involves moving \$700 from a  
customer's savings ..., Mathematical  
properties. Because quantization is a  
many-to-few mapping, it is an inherently  
non-linear and irreversible process (i.e.,  
because the same output value is shared by  
multiple input values, it is impossible, in  
general, to recover the exact input value  
when given only the output value).. The set  
of possible input values may be infinitely  
large, and may possibly be continuous and
