DEEP WATER TURBIDITE SYSTEMS
REPRINT SERIES VOLUME 3 OF THE IAS
INTERNATIONAL ASSOCIATION OF
SEDIMENTOLOGISTS REPRINTS PDF -
Search results, A turbidite is the geologic
deposit of a turbidity current, which is a type
of sediment gravity flow responsible for
distributing vast amounts of clastic sediment
into the deep ocean, GCSSEPM Foundation
Deep-Water Core Workshop, Northern Gulf
of Mexico, Houston, Texas, March 10, 2002
3 Core, Log, and Seismic Characteristics of a
High-Performance Turbidite, ABSTRACT:
Seismic facies analysis and seismic
geomorphology are important tools for the
analysis of depositional elements in
subsurface. This paper aimed to investigate
the character and genesis of depositional
elements and erosive features associated
with an Eocene progradational shelf margin
in northern Santos Basin., A turbidity current
is most typically an underwater current of
usually rapidly moving, sediment-laden water
moving down a slope. Turbidity currents can
also occur in other fluids besides water.. In

the most typical case of oceanic turbidity
currents, sediment laden waters situated
over sloping ground will flow down-hill
because they have a higher density than the
adjacent waters., References Cited Asmus,
