It features two new sections, A semiconductor material has an electrical conductivity value falling between that of a conductor " such as copper, gold etc. " and an insulator, such as glass.Their resistance decreases as their temperature increases, which is behaviour opposite to that of a metal. Their conducting properties may be altered in useful ways by the deliberate, controlled introduction of impurities ("doping ... , i „iz•isCEejœ iz•e£CEi«. A device that converts other forms of energy into electrical energy (a "transducer") provides an emf as its output. (The word "force" in this case is not used to mean mechanical force, as may be measured in ..., Lista de mucho Libros y
