rate $\sim -g/C_p$ is indeed very common, but it is NOT the "equilibrium" condition. Instead it is the typical "steady-state" condition when there is a heat flow up through a gas (which there is in every atmosphere of every planet and moon in the solar system)., Either I read this wrong or they're saying they can theoretically break the laws of thermodynamics; "Matter and energy can neither be created nor destroyed, but can be converted from one to the other."
