It is a stochastic volatility model: such a model

assumes that the volatility of the asset is not constant, nor even deterministic, but follows a random process, Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this., Stochastic Calculus for Finance evolved from the first ten years of the Carnegie Mellon Professional Master's program in Computational Finance., BIDIRECTIONAL INFLUENCE 387 Data relevant to these hypotheses have been inconsistent.
