Electric power is transformed to other forms

of energy when electric charges move

through an electric potential difference, which

occurs in electrical components in electric

circuits. From the standpoint of electric

power, components in an electric circuit can

be divided into two categories:, Your free

composed of individual electronic

components, such as resistors, transistors,

capacitors, inductors and diodes, connected

by conductive wires or traces through which

electric current can flow. To be referred to as

electronic, rather than electrical, generally at

least one active component must be present.

The combination of components and wires

- A transistor is a small electronic device that

can cause changes in a large electrical

output signal by small changes in a small

input signal. That is, a weak input signal can

be amplified (made stronger) by a transistor.

For example, very weak radio signals in the

air can be picked up by a wire antenna and

processed by transistor amplifiers until they

are strong enough to be ..., Grounding &

combined is by scaling (multiplication of the
signals by constants) followed by
addition. For instance, a signal cannot be
multiplied by another signal.
