Raman spectroscopy (/ Ē r Ē• m Ē™n /; named after Indian physicist Sir C. V.

Raman) is a spectroscopic technique used to

observe vibrational, rotational, and other low-frequency modes in a system. Raman

spectroscopy is commonly used in chemistry to provide a structural fingerprint by which

molecules can be identified. It relies on inelastic scattering, or Raman scattering, of

monochromatic ..., A molecular vibration occurs when atoms in a molecule are in

periodic motion while the molecule as a whole has constant translational and

rotational motion. The frequency of the periodic motion is known as a vibration

frequency, and the typical frequencies of molecular vibrations range from less than 10

13 to approximately 10 14 Hz, corresponding

to wavenumbers of approximately 300 to

3000 cm ..., "Just Accepted" manuscripts are
