results, The energy always moves from a warmer system to a colder system. The energy which is moving from one system to another is known as heat. The transfer or dispersion of heat can occur by means of three main mechanisms, conduction, convection and radiation. In thermodynamics, heat is energy transferred from one system to another as a result of thermal interactions. The amount of heat transferred in any process can be defined as the total amount of transferred energy excluding any macroscopic work that was done and any transfer of part of the object itself. When two systems with different temperatures are put in contact, heat flows spontaneously ..., A heat exchanger is a device used to transfer heat between two or more fluids. The fluids may be separated by a solid wall to prevent mixing or they may be in direct contact. They are widely used in space heating, refrigeration, air conditioning, power stations, chemical plants,

petrochemical plants, petroleum refineries, natural-gas processing, and sewage treatment., Principles of Heat and Mass Transfer, ISV [Theodore L Bergman] on Amazon.com. *FREE* shipping on qualifying offers.
