Introduction- STEAM POWER PLANT: A thermal power station is a power plant in which the prime mover is steam driven.

Water is heated, turns into steam and spins a steam turbine which drives an electrical generator. After it passes through the turbine, the steam is condensed in a condenser and recycled to where it was heated; this is known as a Rankine cycle., A nuclear power plant or nuclear power station is a thermal power station in which the heat source is a nuclear reactor.As it is typical of thermal power stations, heat is used to generate steam that drives a steam turbine connected to a generator that produces electricity.As of 23 April 2014, the IAEA report there are 449 nuclear power reactors in operation operating in 31 countries., The Chernobyl Nuclear Power Plant or Chernobyl Nuclear Power Station (Ukrainian:
