“Principles” of sequence stratigraphy

are to a large extent independent of the type

of depositional environments established

within a sedimentary basin (e.g., siliciclastic

vs. carbonate), and clastic systems are

generally used by default to explain and

exemplify the concepts., Principles of

geology that deals with the formation,

composition, sequence, and correlation of

stratified rocks. Since the whole Earth is

stratified, at least in a broad sense, bodies of

all the different types of rock “ igneous,

sedimentary, and metamorphic “ are

subject to stratigraphic study and analysis.,
